NOTIFICATION DATE	DELIVERY MODE
08/05/2008	ELECTRONIC

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

ip.department.us@nxp.com

Office Action Summary	Application No.	Applicant(s)	
	10/587,607	PESSOLANO, FRANCESCO	
	Examiner	Art Unit	
	JI H. BAE	2115	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE *3* MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *27 July 2006*.

2a)☐ This action is **FINAL**. 2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1-14* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1-14* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☒ The drawing(s) filed on *27 July 2006* is/are: a)☒ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☒ All b)☐ Some * c)☐ None of:

1.☒ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☒ Information Disclosure Statement(s) (PTO/SB/08) Paper No(s)/Mail Date *7/27/2006*.
4) ☐ Interview Summary (PTO-413) Paper No(s)/Mail Date. _____ .
5) ☐ Notice of Informal Patent Application
6) ☐ Other: _____.

DETAILED ACTION

Claim Objections

Claim 6 is objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim should refer to other claims in the alternative only. In this case, the claim is dependent from claims 1 and 5 at the same time. See MPEP § 608.01(n). Accordingly, the claim has not been further treated on the merits.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

> The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

The following is a quotation of the second paragraph of 35 U.S.C. 112:

> The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 12-14 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

Claims 12-14 are also rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Regarding claims 12-14, the claims recite a second clock generation means arranged and configured to generate a clock signal at the nominal frequency, with the outputs of the

second clock generation means and a first clock generation means being coupled to a clock output by switch means. It is clear from the recited elements that claims 12-14 are directed towards the embodiment shown in Fig. 3, wherein the claimed “second clock generation means” corresponds to the external clock of Fig. 3 **[applicant’s spec, pp 9, line 18, external clock provides nominal clock frequency]**. The specification further describes a programmable ring oscillator in Fig. 3 as "an internal clock oscillator 10, ***but only to generate the maximum frequency***" **[pp. 9, lines 19-20]**. Thus, the claimed first and second clock generation means correspond to the programmable ring oscillator output and external clock, respectively, which are coupled to the clock mux 18 in Fig. 3.

However, claim 12 is dependent from claim 7, which only recites a single clock generation means. Additionally, claim 7 recites that the single clock generation means is responsible for generating ***both the nominal frequency and the maximum frequency*** in a mutually exclusive fashion **[claim 7, step iii, step a, and step b]**. From the elements recited, it is clear that claim 7 is directed towards the embodiment shown in Fig. 1. However, applicant’s specification does not disclose the embodiments shown in Fig. 1 and 3 as a single embodiment useable together. Rather, applicant's specification teaches that they are two alternative embodiments. The two embodiments are not useable together because they present conflicting features -- specifically, the source of the nominal clock frequency. Claims 12-14 are therefore unsupported by the specification because the specification teaches that Fig. 1 and 3 represent two different embodiments that are not useable together.

Additionally, claims 12-14 are rejected as failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention because applicant has not clearly recited the source of the nominal clock signal. Claim 7 recites that it is provided by the originally recited clock generation means, while claim 12 recites that it is provided by a second

clock generation means which is different from the originally recited clock generation means. Additionally, the examiner points out that there is insufficient antecedent basis for the first clock generation means in the claims 12 and 13. The parent claim only recites a single programmable clock generation means, and does not identify it as a first clock generation means.

Claims 12-14 will not be further treated on the merits. The contradictory nature of claims 7 and 12 precludes a search for prior art, since applicant has provided contradictory limitations regarding the source of the nominal clock signal.

Claims 6 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claim 6 is an improper multiple dependent claim, since it is dependent from both claim 5 and claim 1. As such, it is unclear what the intended metes and bounds of the claim are, since the claim cannot be dependent from both claim 5 and claim 1.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

> A person shall be entitled to a patent unless –
>
> (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-4 and 9 are rejected under 35 U.S.C. 102(e) as being anticipated by Klock et al., U.S. Patent No. 7,382,366.

Regarding claim 1, Klock teaches a method comprising:

generating a clock signal at an initial frequency **[col. 5, line 10-12, clock has a default setting]**;

increasing the initial frequency in a step-wise manner **[col. 4, lines 43-47, increasing the clock frequency by 0.5 MHz or 1 MHz increments]**, and determining the operation of the system at each of a selected number of frequencies until a clock frequency is identified at which the processor does not operate correctly **[col. 4, lines 39-47, stress testing and detecting failures]**; and

identifying a maximum clock frequency at which the system can operate correctly, characterized in that:

the maximum clock frequency comprises the frequency immediately previous to the one identified as being one at which the system does not operate correctly **[col. 4, lines 47-49, highest overclocking parameters that pass the stress test]**; and in that

a timing monitor is provided for determining whether or not the system can operate within system timing constraints at each frequency, thereby indicating whether or not the system operates correctly at the respective frequency **[col. 3, lines 39-51, overclocking control module includes performance monitoring functionality, graphics pipeline stress tester detects errors generated by a test sequence]**.

Regarding claim 2, Klock teaches storing the maximum frequency in memory **[col. 5, lines 23-38, internal table stores maximum clock rates]**.

Regarding claim 3, Klock teaches periodically performing the method of claim 1 while the system is running **[Fig. 5]**. Fig. 5 shows that after the stress test fails, the system selects a clock frequency below the failing frequency with sufficient margin **[Fig. 5, step 570]**, and returns to the beginning step 520, wherein the method may be repeated.

Regarding claim 4, Klock teaches the method of claim 1, and also the apparatus with means to execute the claimed method.

Regarding claim 9, Klock teaches a frequency finder for increasing the frequency of the clock signal from the initial frequency to the maximum frequency **[Fig. 2, clock controller].**

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Klock in view of applicant's admission of prior art. Although Klock does not explicitly teach that the clock generators in Fig. 2 are ring oscillators, applicant teaches that ring oscillators are known in the art, and cites an exemplary patent reference **[pp. 8, lines 17-20]**. Since ring oscillators are known in the art as clock generators, it would have been obvious to one of ordinary skill in the art to include applicant's admitted prior art in the system of Klock as an obvious variation of the clock generators taught by Klock in Fig. 2.

Claims 5, 7, 8, and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Williams, U.S. Patent No. 5,774,704, in view of Rosno et al., U.S. Patent No. 6,535,986. Both Williams and Rosno are applicant-cited references.

Regarding claim 5, Williams teaches a method comprising:

generating, after reset, a clock signal at a nominal frequency, less than the maximum frequency **[Fig. 5A, step 502, initial clock frequency]**, until a signal is received indicating that

an increased clock frequency is required **[Fig. 5A, steps 505 and 506, max clock frequency required due to high processor load]**;

generating, in response to receipt of the signal, a clock signal at the maximum frequency for a required time **[Fig. 5A, step 506, clock frequency increased to maximum]**; and then

once again generating a clock frequency at the nominal frequency **[col. 7, lines 1-4, process repeats, going back to Fig. 5A, step 503, if high load not detected and clock frequency is maximum from a previous setting, then clock frequency is decreased, step 507 and 508]**.

Although the method taught by Williams teaches setting a predetermined maximum clock frequency, Williams does not teach determining a maximum clock frequency at which the system can operate within system timing constraints.

Rosno teaches a method comprising:

determining, when the system is reset **[col. 6, lines 15-16, method is performed at every initial program load]**, a maximum clock frequency at which the system can operate within system timing constraints **[col. 6, lines 1-11, highest possible frequency with acceptable timing margin]**.

It would have been obvious to one of ordinary skill in the art to combine the teachings of Williams and Rosno by implementing the method of Rosno in the system of Williams to determine the maximum clock frequency taught by Williams. The system of Williams assumes the existence of some predetermined maximum clock frequency, but does not disclose a method for determining the maximum clock frequency. Rosno's background disclosure teaches that it is not desirable to simply run a clock at the fastest possible frequency, since violations of timing margins can lead to erroneous operations **[col. 2, lines 1-12]**. Therefore, it would have been obvious to one of ordinary skill in the art to implement the method of Rosno in the system

of Williams, with the predictable result that Rosno would have provided a method to determine a maximum clock frequency for Williams. Additionally, the method of Rosno would have improved Williams by providing a clock frequency with sufficient timing margin to prevent errors during operation.

Regarding claim 7, Rosno teaches the method of claim 5, and also the apparatus with means to execute the claimed method.

Regarding claim 8, Rosno teaches a timing monitor for monitoring system timing constraints **[Fig. 1, state machine or service processor, col. 5, lines 53-60, state machine or service processor detects errors at the given clock frequency setting]**.

Regarding claim 11, Rosno teaches a frequency finder and selector for determining the maximum frequency at reset **[col. 5, lines 18-42, state machine, frequency synthesizer, PLL/DM/SCC control clock frequency and settings]**. Williams teaches receiving a request for an increase in clock frequency and causing the clock generation means to generate a clock signal at the maximum frequency until the request expires or is withdrawn **[Fig. 5A, steps 505 and 506, max clock frequency required due to high processor load, col. 7, lines 1-4, process repeats, going back to Fig. 5A, step 503, if high load not detected and clock frequency is maximum from a previous setting, then clock frequency is decreased, step 507 and 508]**.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure:

Fister, U.S. Patent No. 6,324,657,

Cheng et al., U.S. Patent No. 6,963,992,

Fitzgerald et al., U.S. Patent No. 6,014,033,

DeLuca et al., U.S. Patent No. 5,218,705,

Hoover et al., U.S. Patent Application Publication No. 2004/0105237.
